Tank-mixing Glyphosate and Micronutrients

There is interest in tank-mixing foliar micronutrient fertilizers with glyphosate (the active ingredient in Roundup® brand agricultural herbicides) to save time and application costs. However, this practice is not recommended because it can result in reduced weed control.

**Micronutrient Foliar Sprays**

Foliar sprays of micronutrients are used in crops, such as foliar manganese (Mn) fertilizer in soybeans. Other micronutrients that may be applied in foliar sprays include boron (B), copper (Cu), iron (Fe), molybdenum (Mo), and zinc (Zn), which are positively (+) charged cations when dissolved in water. Since many foliar sprays are applied around the time of glyphosate treatments in Roundup Ready® crops, there is interest in tank-mixing glyphosate and micronutrients.

**Antagonism with Glyphosate**

Glyphosate can bind to micronutrients in the spray solution. This can cause glyphosate to become inactive and simultaneously convert the micronutrient into a form less useable by the crop. Glyphosate is negatively (-) charged when dissolved in water and can be tied up by positively (+) charged micronutrient cations. Weed control may be affected because the glyphosate-micronutrient complex can reduce the absorption and translocation of the herbicide in the plant.

Some of this antagonism can be reduced by adding ammonium sulfate (AMS) to the spray solution before adding glyphosate. However, the antagonism will not be completely overcome by adding AMS or other additives to the spray solution. Some micronutrient formulations, such as those containing EDTA, can be less antagonistic with glyphosate, but again not completely.

**Recommendation**

It is not recommended to tank mix glyphosate herbicides with micronutrients or foliar fertilizers. It is also best to separate applications of a foliar micronutrient and glyphosate herbicide by more than a week. This helps to allow for maximum uptake and translocation of glyphosate by weeds and foliar fertilizer by the crop.

Monsanto Company is a member of Excellence Through Stewardship® (ETS). Monsanto products are commercialized in accordance with ETS Product Launch Stewardship Guidance, and in compliance with Monsanto’s Policy for Commercialization of Biotechnology-Derived Plant Products in Commodity Crops. This product has been approved for import into key export markets with functioning regulatory systems. Any crop or material produced from this product can only be exported to, or used, processed or sold in countries where all necessary regulatory approvals have been granted. It is a violation of national and international law to move material containing biotech traits across boundaries into nations where import is not permitted. Growers should talk to their grain handler or product purchaser to confirm their buying position for this product. Excellence Through Stewardship® is a registered trademark of Biotechnology Industry Organization.

ALWAYS READ AND FOLLOW PESTICIDE LABEL DIRECTIONS. Roundup Ready® crops contain genes that confer tolerance to glyphosate, the active ingredient in Roundup® brand agricultural herbicides. Roundup® brand agricultural herbicides will kill crops that are not tolerant to glyphosate. **Tank mixtures:** The applicable labeling for each product must be in the possession of the user at the time of application. Follow applicable use instructions, including application rates, precautions and restrictions of each product used in the tank mixture. Monsanto has not tested all tank mix product formulations for compatibility or performance other than specifically listed by brand name. Always predetermine the compatibility of tank mixtures by mixing small proportional quantities in advance.
